

Extended Affine and CCZ Equivalence up to Dimension 4

Marcus Brinkmann*

Ruhr University Bochum

Abstract

For all vectorial boolean functions up to dimension 4, we present canonical representatives for all extended affine (EA) and CCZ equivalence classes. We include the size of each class, as well as its algebraic degree and extended Walsh spectrum. We also answer the following questions: How large are these classes? Which of these classes contain bijective functions? And how are these classes grouped into CCZ equivalence classes?

1 Introduction

Vectorial boolean functions $s : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ have many applications, especially if they come with additional properties. For example, *almost perfect nonlinear* (APN) functions are used in block ciphers to resist differential attacks [1].

The APN property (among others) is invariant under affine and other transformations, narrowing the search for suitable candidates to representatives from each equivalence class. In fact, if α, β are affine bijections, and γ is any affine function, then we define $t, s : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ to be *extended affine* (EA) equivalent, if $t = \beta s \alpha + \gamma$.

In [2], a more general equivalence relation was introduced that includes EA equivalence as a special case. Let $\mathcal{G}(s) := \{(x, s(x)) \mid x \in \mathbb{F}_2^n\} \subseteq \mathbb{F}_2^n \times \mathbb{F}_2^n$ be the graph of the function s . Then a function t is *CCZ equivalent* to s if $\mathcal{G}(t)$ is affine equivalent to $\mathcal{G}(s)$ in $\mathbb{F}_2^n \times \mathbb{F}_2^n$, that is if there exists an affine bijection $\lambda \in \mathbb{F}_2^{2n}$ such that $\mathcal{G}(t) = \lambda(\mathcal{G}(s))$. It was proven in [2] that this equivalence relation stabilises the APN property.

In [3], we give a complete classification of APN functions up to dimension 5, applying efficient canonicity filters to backtrack programming. Using the same methods, we are also able to classify all vectorial boolean functions (i.e., not only those APN) up to dimension 4 modulo extended affine and CCZ equivalence. Although results for higher dimensions are more interesting (e.g., there are 8 bits in a byte),

low dimension results can still be useful for efficient construction of functions in higher dimensions, see for example [4]. Thus, we give our complete results for dimension 4 here as a reference.

2 Methodology

We use depth-first backtrack programming with efficient EA canonicity filters to prune the search tree, as in [3]. A function is a *canonical representative* of its class if its function table is the smallest lexicographically in the alphabet \mathbb{F}_2^n .

2.1 Table Layout

The tables below enumerate all EA classes and their canonical representative by giving their function table.

We include the algebraic degree, which is an EA (but not CCZ) invariant. Note that for this to be true, we give the degree of the class containing $s \equiv 0$ as 1.

We also include the extended Walsh spectrum, which is the multi-set $W_s := \{|w_s(a, b)| \mid a, b \in \mathbb{F}_2^n, b \neq 0\}$ where $w_s(a, b) = \sum_{x \in \mathbb{F}_2^n} (-1)^{bs(x) + ax}$. The extended Walsh spectrum is known to be a CCZ (and thus also EA) invariant [2].

We further check for CCZ equivalence among the EA canonical representations. Because CCZ equivalence implies EA equivalence, this is sufficient to find representatives for all CCZ classes. In the tables below, the column *CCZ* either says "can." if this entry is also a canonical representative for CCZ equivalence, or it gives the index of a CCZ canonical representative to which this entry is CCZ equivalent.

We directly check for EA equivalence to bijective functions. If an entry in the table is EA equivalent to a bijective function, the column "bij.?" contains the letter "Y" (for "yes"), otherwise it contains the letter "N" (for "no").

2.2 Total Number of Functions

The total number of functions in $\mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ is $(2^n)^{2^n}$. This set is partitioned into EA equivalence classes. To determine

n	$ G^\alpha $	$ G^\beta $	$ G^\gamma $	$ G $
1	2	1	4	8
2	24	6	64	9216
3	1344	168	4096	924844032
4	322560	20160	1048576	6818690079129600

Table 1: The size of the group of affine functions (α, β, γ) acting on s , c.f. A028365, A002884 and A053763 in [5].

the size of each class, we consider the group G of all function triplets (α, β, γ) that acts on $s : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ by means of $(\alpha, \beta, \gamma) \cdot s = \beta s \alpha + \gamma$, where α is an affine bijection, β is a linear bijection, and γ is any affine function (the affine component of β is subsumed by γ). Then the EA equivalence class of s is the orbit Gs and the size is $|Gs| = |G|/|G_s|$, where $G_s = \{(\alpha, \beta, \gamma) \in G \mid \beta s \alpha + \gamma = s\}$ is the *stabiliser* of s .

The order of G is easily counted, as the number of linear bijections is well known (cf. A002884 in [5]):

$$|G| = |G^\alpha| \cdot |G^\beta| \cdot |G^\gamma| \\ = \left(2^n \cdot \prod_{i=0}^{n-1} (2^n - 2^i) \right) \cdot \left(\prod_{i=0}^{n-1} (2^n - 2^i) \right) \cdot (2^n)^{n+1} \quad (1)$$

See Table 1 for the order of $|G|$ up to dimension 4.

For example, to calculate the size of the equivalence class $s = s_1$ in Table 9, we have $|Gs| = |G|/|G_s| = 6818690079129600/6502809600 = 1048576$.

3 Results

3.1 Dimension $n = 1$

In dimension $n = 1$ we have only a single EA equivalence class, see Table 3. It contains all four functions, including the two bijective functions. All functions are linear, and have the same Walsh spectrum (Table 2).

3.2 Dimension $n = 2$

In dimension $n = 2$ we have two EA equivalence classes, one containing the bijective functions, see Table 5. They have distinct Walsh spectrums (Table 4) and thus are also different CCZ equivalence classes.

3.3 Dimension $n = 3$

In dimension $n = 3$, we have seven distinct EA equivalence classes, four containing bijective functions (and these are all linear or quadratic), see Table 7. They all have distinct Walsh spectrums (Table 6), and thus also represent different CCZ equivalence classes.

3.4 Dimension $n = 4$

In dimension $n = 4$, we find 4713 different EA equivalence classes (with 71 different sizes), of which 194 contain bijective functions (while 4519 do not), see Table 9. The classes have 481 distinct Walsh spectrums (Table 8). However, the number of CCZ equivalence classes is 4151 and thus much larger (only 562 EA canonical representatives are not also CCZ canonical representatives).
